配置文件

自动扫包

在horse-framework-starter-mysql中 设置了全局的扫包,package需要命名为mapper,则会自动扫包

```
1 @MapperScan(basePackages = "com.msb.**.mapper")
```

整合插件

```
1 @Bean
2 public MybatisPlusInterceptor paginationInterceptor() {
3     MybatisPlusInterceptor mybatisPlusInterceptor = new MybatisPlusInterceptor
4     mybatisPlusInterceptor.addInnerInterceptor(new BlockAttackInnerInterceptor
5     mybatisPlusInterceptor.addInnerInterceptor(new OptimisticLockerInnerInterceptor
6     mybatisPlusInterceptor.addInnerInterceptor(new PaginationInnerInterceptor
7     return mybatisPlusInterceptor;
8 }
```

整合、乐观锁、分页、防全表删除等插件

提供BaseEntity,包含4个基础属性,继承该类后框架会自动在新增、修改时设置操作人、操作时间

```
1  @Getter
2  @Setter
3  public class BaseEntity implements Serializable {
4           @TableField(fill = FieldFill.INSERT)
5           private LocalDateTime createTime;
6           @TableField(fill = FieldFill.UPDATE)
7           private LocalDateTime updateTime;
8           private Long createUser;
9           private Long updateUser;
10 }
```

自动设置操作人、操作时间

在新增、修改实体时,框架根据UserContext 获取当前登录人的id 自动设置到表中对应字段,无需在业务侧主动操作

```
@Component
   public class DataOperationInterceptor implements MetaObjectHandler {
2
3
       private Long getCurrentUserId() {
4
5
           Optional<UserLoginInfo> userLoginInfo = Optional.ofNullable(UserConte
           if (userLoginInfo.isPresent()) {
6
               return userLoginInfo.get().getId();
7
8
           return 0L;
9
10
       }
11
12
       @Override
       public void insertFill(MetaObject metaObject) {
13
           this.strictInsertFill(metaObject, "createTime", LocalDateTime::now, I
14
           this.strictInsertFill(metaObject, "createUser", Long.class, getCurrer
15
           this.strictInsertFill(metaObject, "isDeleted", () -> Boolean.FALSE, E
16
17
       }
18
19
       @Override
       public void updateFill(MetaObject metaObject) {
20
21
           this.strictUpdateFill(metaObject, "updateTime", LocalDateTime::now, L
22
           this.strictInsertFill(metaObject, "updateUser", Long.class, getCurrer
23
       }
24 }
```

注意: 只有使用save(entity)和update(entity)的时候MybtaisPlus才会自动设值,在根据UpdateWrapper执行更新时需要手动设置时间和操作人,其实也不难理解。
